

## Calypso Introduces Serial-IR Translation

The UT-500 Provides Universal, Bi-Directional Translation

**20 May 2006 – Hudson, WI.** Calypso Control Systems has introduced the UT-500 universal, bi-directional translator, capable of converting any combination of IR and Serial commands. With an on-board 32-item translation table, along with built-in IR and Serial learning, this small device translates any IR-to-IR, IR-to-Serial, Serial-to-Serial or Serial-to-IR. The translation table is configured using a serial programming port and companion software.

While the UT-500 is a general purpose tool, it was designed specifically to address situations when a change in equipment (e.g., projector) necessitates a change in control system software to reflect new device protocols. With the UT-500 in place, the control system software change becomes unnecessary, saving both time and money. Likewise, the UT-500 is extraordinarily useful when control system source code is unavailable.

### About Calypso Control Systems

Founded in 1999 Calypso Control Systems delivers innovative control and monitoring hardware and software solutions for professional AV applications. Calypso products such as Pro I/O and ION controllers simplify and speed the creation of control solutions by introducing an integrated event database and through patent-pending c\_Link, which integrates control interfaces directly into PowerPoint and Word and on Windows, Macintosh and Linux desktops. Calypso products are sold exclusively through AV industry dealers and system integrators worldwide. [www.calypsocontrol.com](http://www.calypsocontrol.com)
