

## Little Pebble. Big Splash.

Over the past six months Calypso has introduced a range of products that are shaking up the AV industry. Our approach to control changes the way integrators, consultants and customers think about, develop, deploy, use and support device control. The bottom line is that we've de-mystified the beast and found the middle ground between simplicity and complexity, between flexible and rigid and between mainstream and specialty solutions. Calypso solutions fit into high volume, short timeline, low budget small room projects while providing strong dealer margins and exceeding customer expectations. Hyperlink compatibility, an on-board web server, a control database and, of course, no code-writing are just the beginning.

### New Products

#### CA-500 / CA-1000 Controllable Amplifiers

The CA-500 is a small format, single input 32W stereo audio amplifier with IR and Serial control, a software EQ, flash memory for storing pre-recorded messages and a PA detect circuit used to automatically mute audio when a PA system is in use. The CA-1000 provides expanded functionality with three discrete inputs (e.g., DVD, PC and Wireless Microphone) and an on-board software mixer, useful for presets and automated audio ducking.

#### UT-500 Serial / IR Translator

The UT-500 is a small format device that provides bi-directional translation of any IR and Serial string to any Serial and IR string. The on-board translation table holds up to 32 events and is configured through a serial programming port using accompanying software. IR and Serial learning are included in the UT-500.

## Connect. Configure. Create.
