

Encore! 1.0 Eases/Speeds Control Interface Development

Software Brings Graphic Control Interface Tools to Non-Programmers

25 August 2006 – Hudson, WI. Calypso Control Systems has announced the release of encore! 1.0 pc-based control interface developer software. Designed to speed and ease the process of building pc-based control solutions, encore! 1.0 delivers a rich set of tools allowing non-programmers to build custom, intuitive and reliable graphical control interfaces for small and mid-size presentation applications. Encore! is ideal for PC-based control applications in classrooms, board rooms, training centers and other small-room presentation projects.

Using a standard Windows drag-and-drop approach, encore! offers features such as pre-defined button libraries with custom sizing and labeling, graphic import, scheduled events, interface templates, button hold-down and automated 3rd party exe launching. Encore! is designed to be used either on a stand-alone basis – steering user-defined commands through serial ports or to IP addresses – or in conjunction with Calypso ION, Pro I/O or UT controllers. Of course, encore! takes full advantage of the event database architecture found on all Calypso controllers, simplifying the process of triggering control by sending event numbers to controllers, over a network, complete with full 128-bit encrypted security.

“Encore! strikes just the right balance between ease of use, functionality and price. It ends up taking a good bit of the mystery out of control interface development, making PC-based control much more affordable and effective.”, noted Rick Mathewson, Calypso’s Vice President of Product Marketing.

A fully functioning demo version of encore! can be downloaded from www.idt.com.au
